Rotating File Holder for Collating

Left: Floor stand version

Right: Table-top version

A woman in her 40's with cerebral palsy who worked as a clerk had recently had shoulder surgery. She had always used crutches to get around prior to the surgery, and her shoulders required surgery due to overuse. Post surgery, she needed to use a wheelchair. A large part of her job was collating up to 25 sheets of paper in packets that were mailed out to clients. A rotating file holder was designed and fabricated to reduce the reaching required for her position. The floor stand allowed her to roll it to the file cabinets to get stacks of each form; and then move it to her desk where she put the packets together.

A letter received from her:

"Thank you for the fabulous rotating files. They are very comfortable to work with and they save a lot of time and effort. They get a lot of compliments. I really enjoy working with them."
